Continuation of 5. does NOT place the application in condition for allowance because: Applicant argues that Flaker fails to identically disclose the claimed feature of the last limitation in claim 1 in which Flaker's body link 31 does not include a portion having no impurities of the second conductivity type. The reference discloses removal of the shallow doped region through oxidation or through selective etching to leave the p-type conductive link. Applicant has not established that there would not be a portion of the link region which does not contain n-type dopant.

The rejection of claims 7-9 under 35 U.S.C. 103(a) relying on Ooishi is withdrawn. Instead, any region under the FET's source/drain of Flaker could be considered as a dummy region not to function as an element.
